Experience always shows that measures to reduce the idle times of your machines are significantly more worthwhile than chasing seconds in the actual machining process. The solution is a stable and exact reference system. This lets you preset away from the machine and then set up the machine with minimum idle time. Quickly and precisely!

Fitting the machines with the same reference system means that electrodes and workpieces can be moved between the machines without subsequent alignment and checking – One Minute Set-up.
A reference system minimises setup times
Every minute that can be converted from internal to external setting time increases the spindle time of the machine and with it the productivity of the business.

Big earnings are within your reach
The machine generates revenue when its spindle is turning – and only then.
Work smarter, not harder.

Above list is only a rough guidance which may deviate between article number of pallets as well as individual application. Please check with local 3R representative for more detailed confirmation.
The Z-references of the chuck have generously-sized surfaces to ensure the highest stability.

The references of the pallet are created directly in the pallet and on a single plane. There are no loose parts to be installed and adjusted by the user.

The X and Y references of the chuck are made of cemented carbide.

The Z-references are automatically air-blast cleaned, through nozzles in the Z-references of the chuck.

Turbo locking. Extra locking force is provided by air-blast cleaning air which is automatically diverted to the locking piston when the Z-references seal against each other.

Drawbar with floating bayonet fitting. No traction forces, ultimate accuracy.

The lip edge of the pallet is angled to match the angle of the boss. This maximises the mating surface area between the parts, resulting in precision alignment, minimal wear and enduring precision.
VDP (Vibration-Damped Palletisation)

With conventional chucks, vibrations of the workpiece caused by the dynamic forces due to the action and rotation of the cutting tool. Restrictions therefore have to be imposed on the rotation speed and feed rate of the cutting tool, to prevent instability and to achieve the necessary surface quality.

**Advantages of a damped chuck**

After intensive research into the dynamics of chuck systems, machine tool maker System 3R has developed and patented a chuck with vibration-damped palletisation (VDP). By reducing the vibrations of the workpiece and a considerable proportion of the vibrations of the cutting tool, the VDP technology improves the dynamics of the entire metal cutting process. This means that machine tools can be operated at higher speeds with greater accuracy and at the same time with less wear. Workpieces can usually be produced in a single operation within strict dimensional tolerances and with a surface quality in the micrometer range – a millionth of a metre.

- Higher material removal rate improves productivity.
- Better surface finish reduces the need for finishing.
- Less tool wear extends the life of the cutting tools.
- Less vibration in the machine spindle.
- Better dimensional accuracy gives fewer rejects.
- Greater scope for machining difficult materials and complex shapes.
- Shorter lead times thanks to a higher material removal rate.
- Lower noise level during machining.

**Example Micro Milling:**

VDP advantages: The electrode Aspect Ratio (L/Ø) was doubled with VDP.
Dimensions: Ø 0.134 mm, length 4.8 mm

The diagram shows the effect on the oscillation amplitude when machining with the workpiece clamped conventionally and in a damped chuck.

Process Stability Analysis (Swiss machine tool manufacturer)
If you want to compete in the global manufacturing industry, you need to study every aspect of efficiency. It's a matter of extracting the highest possible number of spindle-hours from each machine, every day of the week. And here, the importance of a high-class reference system can never be over-estimated. A reference system which reduces setup times to a few minutes.

Macro is such a reference system. A system that minimises the throughput time, and which, thanks to its accuracy, practically eliminates rejects. A system that increases flexibility and profitability. A system that increases competitiveness and ensures the success of its users.

Among users world wide, the Macro system is a byword for precision. And with good reason, since very single Macro product is thoroughly checked before it is dispatched. But precision can be graded too. The Macro products are therefore “classified” in terms of accuracy, material and life – but always with full compatibility – as Standard, High Performance and Nano. Even so, it’s worth remembering that the accuracy of a system is determined by the product with the lowest classification.

+ Repetition accuracy:
  - MacroNano – within 0.001 mm
  - MacroHighPerformance – within 0.0015 mm
  - MacroStandard – within 0.002 mm
+ Locking force – 6000 N
+ Fixed index positions 4x90°
+ Required air pressure, pneumatic chuck – 6±1 bar
+ Recommended tightening torque, manual chuck – 6 Nm
+ Recommended max workpiece weight – 50 kg.

MacroNano

... Extremely high accuracy.
... High-precision machines are linked together in the production chain, without detracting from the extreme accuracy.
... Feedback to the machine for supplementary machining after inspection is possible. This feedback is only meaningful if the pallet system is at least as accurate as the measuring machine.

Workholding for Nano Precision

Nano-precision machining requires nano-precision referencing of workpieces and tools–a real challenge even with state of the art solutions available in the market. This becomes even more challenging when the references need to be established in the shortest possible time.

MacroNano system is best described in two words as precise and quick! The MacroNano clamping system links the production chain through an ultra-precision coupling both for workpiece and tool holding.

+ Repetition accuracy – within 0.001 mm
+ Locking force – 6000 N
+ Fixed index positions 4x90°
+ Required air pressure, pneumatic chuck – 6±1 bar
+ Recommended max workpiece weight – 50 kg.
This micro structure is produced by Diamond Flycutting operations on two different machines, each equipped with a MacroNano chuck. The square in the middle of the workpiece (right picture) is produced by plane milling on 1st machine, making use of indexing feature of the MacroNano system. The pallet carrying the workpiece is then transferred to the chuck on 2nd machine to produce the micro-grooves, once again using the indexing feature. The zero reference was determined only once on the 1st machine and then carried through the whole process chain using both the indexing precision and the system precision of the MacroNano system; overall structure deviation is less than 0.5 micron.

MacroMagnum

... allows mounting of both MacroMagnum and Macro pallets
... reduces setting-up times
... ensures precision and quality
... can handle high machining forces
... is suitable for automatic changing with System 3R’s automation program.

MacroMagnum is a larger variant of the patented Macro system. The high clamping force and the position of the reference surfaces far away from the chuck centre mean that MacroMagnum can provide “Macro class” stability and accuracy, even in applications with high machining forces. The double references of the chucks mean that in addition to the MacroMagnum pallets, the extensive range of Macro pallets can also be fixed to MacroMagnum.

The difference between a pallet and a reference element

Usually the electrode blank is mounted directly on the pallet, which then carries the blank throughout the manufacturing process – from machine to machine, without subsequent alignment.

The reference elements are primarily intended to be mounted on the fixtures or vices in which the workpiece will be clamped. The reference elements are significantly thinner in order to limit the total construction height.

System 3R Tooling for parts production
Matrix

... reduces setting-up times
... ensures precision and quality
... has automatic air-blast cleaning of the references
... is sealed against dirt and swarf – withstands severe work environments
... has enhanced clamping force – turbo locking
... is suitable for automatic changing with System 3R’s automation program.

Measures to reduce the downtime of your machines are significantly more worth while than chasing seconds in the actual machining process. What matters is to keep the machines running. And that’s when you need an interface that gives fast setting-up.

The Matrix system is just that kind of interface. Setting-up in parallel away from the machine while it is working and then setting up in a matter of seconds in the stationary machine. Important for long runs, but crucial for the profitability of short runs or one-piece production.

The design has been optimised for metal-cutting machining and is ideal for work involving high machining forces. The generous diameter of the drawbar means short distances between the references and the applied locking force, giving maximum stability and accuracy. The inherent properties of the Matrix system truly come into their own in tough machining applications.

As well as extreme accuracy, Matrix features low construction height, ultra-precise indexing, a drawbar with through hole. The through hole allows high/long workpieces to be sunk into the chuck for stable/rigid fixation.

... has pallet clamping without drawbar.
... has lightweight pallets.
... suitable for automatic changing with System 3R’s automation program.

The machining zero point is defined by the centre of the chuck in the GPS 70 and GPS 120 system. The chucks can be mounted on the machine table of any machine tool.

The standardised hole pattern of the pallet allows the fixation of workpieces, fixtures and accessories such as vices and three-jaw chucks from below. This gives collision-free mounting, even with five-sided machining.

The economical, pressure-die-cast aluminium pallets are very light, making them also suitable for manual handling. Naturally GPS 70 and GPS 120 are also suitable for automatic changing.

The chuck seal prevents dirt penetrating between the chuck and the pallet. This simplifies maintenance and lengthens the life of the components.

System 3R Tooling for parts production

... reduces setting-up times.
... ensures precision and quality.
... is sealed against dirt and swarf.
... has lightweight pallets.
... suitable for automatic changing with System 3R’s automation program.

The machining zero point is defined by the centre of the chuck in the GPS 240 system.

The system is made for universal use and can be used in all kinds of applications milling, turning, grinding, EDM and measuring.

The chuck seal prevents dirt penetrating between the chuck and the pallet. This simplifies maintenance and lengthens the life of the components. A lifting mechanism which operates on locking/opening protects the references when loading heavy workpieces.

The economical, pressure-die-cast aluminium pallets are very light, making them also suitable for manual handling. Naturally the GPS 240 is also suitable for automatic changing.

Their standardised hole pattern of the pressure-die-cast aluminium pallets allows the fixation of workpieces, fixtures and accessories such as vices, three-jaw chucks and magnetic tables directly on the pallet from below. This gives collision-free mounting, even with five-sided machining.

+ Repetition accuracy – within 0.002 mm
+ Indexing accuracy – within 0.005 mm
+ Locking force – 30 000 N (with force boost 60 000 N)
+ Fixed index positions – 4x90°
+ Required air pressure, pneumatic chuck – 6 bar
+ Recommended max workpiece weight – 150 kg
Die-cast aluminium pallets with standardised hole pattern or solid aluminium pallets.

The Z-references are air-blast cleaned, through nozzles in the Z-references of the chuck.

Hardened chuck body with prisms for X/Y centring made out of the piece for maximum stability. Indexing 4x90°.

Connection bloc.

Pallet with handles for manual pallet handling or automated pallet change by robot.

Spring loaded clamping mechanism. Releasing by air.

Seal for a completely sealed chuck-pallet interface against dirt and swarf.

Clamping mechanism with spring clamping force by springs and clamping with balls.

Dynafix

… allows machining with optimal cutting data
… reduces setting-up times
… ensures precision and quality
… gives access to System 3R’s entire product range
… is suitable for automatic changing with System 3R’s automation program.

Dynafix permits machining with optimal cutting data, without sacrificing accuracy and quality. The easy-to-handle aluminium pallets have reference elements of high-alloy steel with directly measurable Z-references.

Locking mechanism with built-in soft-landing function protects the references and simplifies handling in applications involving heavy workpieces. In addition, automatic air-blast cleaning of the Z-references and peripheral sealing make Dynafix a practical and user-friendly reference system which minimises setting-up times, increases machine capacity and provides a basis for automated production.

Dynafix as the basic means of fixing to the machine table gives unsurpassed flexibility in terms of workpiece size. Using chuck adapters provides access to practically every reference system in System 3R’s extensive produkt range. Rapid, precise pallet changing in sizes from Ø25 mm to 400 x 400 mm in the same basic mounting – manually or automatically.

+ Repetition accuracy – within 0.002 mm
+ Locking force – 60 000 N
+ Fixed index positions – 4x90°
+ Required air pressure, pneumatic chuck – 6±1 bar.

Clamping of larger dimensions too, with Delphin

The modular design with the Delphin zero point clamping system offers you the greatest possible flexibility. You can arrange the machine equipment as a baseplate or as a built-up solution, precisely in accordance with your requirements.

Pallets or workpieces can now be positioned and clamped with great accuracy on the Delphin clamping system.

Advantages of the Delphin clamping system

+ Modular design
+ Large product portfolio
+ Uniform clamping spigots
+ Spring centring for pinpoint accuracy

Facts

Repetition accuracy: < 0.005 mm
Clamping force: 13'000N pneumatic
15’000N hydraulic

Function of the Delphin clamping system

One special feature in relation to modular equipping of the machine tables is the option for arrangement and number of chucks. Regardless of the requirements of the application, you determine the quantity and the particular centre distance with which you wish to equip the machine table.

Our recommendation: use at least 4 chucks per workpiece or work with pallets.

The conical clamping spigots are mounted directly in the device or workpiece. Centring of the conical face of the centring and compensating clamping spigots free of play achieves maximum accuracy.

**Delphin BIG**
The newest member of the Delphin family was developed specially for large workpieces.

This opens up entirely new approaches for the production of large workpieces or the manufacture of large moulds.

Because of its optimised shape, the clamping system is highly tolerant during loading of the pallets, by a crane for instance.
